Reply to “has my InvoiceHub batch finished?” without a person looking it up.

Where it lands	1: a script. InvoiceHub already knows every batch’s status; nothing needs judging.
Decided by	Question 1: the rule is written down. The runbook says what each status means and when “processing” counts as stuck.
Error budget	A wrong status reply costs a follow-up ticket, not money. Up to 1 in 50 reopened is fine; above that, switch it off and look.
Cost	Build: two to three days of one developer. Run: effectively free; no model calls.
Owner and off switch	AP systems lead. Off switch: disable the auto-reply rule; tickets go back to the queue as before.

Steps

1. Pull the batch ID out of the ticket with a regex (`IH-\d{6}-\d{2}`).
2. Read the batch status from InvoiceHub.
3. Reply with the status and, if it’s rejected, the reason, using the runbook wording.
4. If there’s no batch ID, or it’s been processing over 2 hours, route to AP systems as today.
5. Count how many tickets it closes, and how many get reopened, for a month.
